

Julieta: I thought Helicon Focus program took photos not scans. Is this equivalent language, scan=photo?

Mark O'Brien: It's a mite.

Christina Byrd: Helicon Focus is an image stacking software.

Julieta: He is using the term "scanning" but it seems these are photographs.

Christina Byrd: the scans have similar file formats as photos: jpegs, tiffs

Gil Nelson: Helicon processes stacks, regardless of the method of image generation.

Christina Byrd: Tell him the program is Not Responding and has to be closed

Gisela Canales: The NanoZoomer can create as many stacks as needed the limiting factor is 50um to 100um

Christina Byrd: I have to go. Thank you for sharing!

Julieta: thank you!!
