A Global Names Architecture

Rationale

- **Taxon Names are the fundamental link among virtually all biodiversity information.**
- **Biodiversity Information relates to species concepts, but data resources are usually tied to text-string names.**
- **Text-string names are difficult to cross-link due to spelling variations, different genus-species combinations, homonyms, synonyms, etc.**
- **Linking text-string names to concepts requires source-based (literature-based) approach.**
- **The key challenge is to cross-link thousands of biodiversity datasets through taxon concepts, using only text-string names.**

Global Names Index (GNI)

- Database and services optimized for taxon names represented as raw text strings. (“**Dirty Bucket**”)
- ~17+ million text strings
- Parsing Services
- Lexical Grouping
- Links back to sources
- Developed at Woods Hole

The screenshot shows the Global Names Index (GNI) website interface. At the top, there are navigation links for 'Index', 'Repositories', and 'Name Parser'. The main header includes the GNI logo and the text 'Global Names Index BETA' and 'Scientific Names Exchange (about)'. Below this is the 'Index of Scientific Names' section, which states 'Index of scientific names provided by all Name Repositories (17,275,622 name strings total)'. A search bar is present with a 'Search' button and a 'Help' link. Below the search bar is a list of letters 'A B C D E F G H I J K L M N O P Q R S T U V W X Y Z'. The search results show 'Results 1 - 30 of total 47 for 'ns:AAA*'' and a list of names. The name 'Aaadonta angaurana Solem 1976' is highlighted. To the right of this name is a 'Parsed information (hide)' section with various fields like 'scientificName', 'parser_version', 'verbatim', 'hybrid', 'normalized', 'details', 'genus', 'species', 'basionymAuthorTeam', 'year', 'authorTeam', 'author', 'authorship', 'string', 'parser_run', 'canonical', 'positions', and 'parsed'. Below this is a 'Lexical groups' section with two entries: 'Aaadonta angaurana' and 'Aaadonta angaurana Solem 1976'. At the bottom right, there is a table with columns 'Logo', 'Data Source', and 'Records #'. The table contains one row: 'Index to Organism Names' with '1 record'.

BELONOPERCA CHABANAUDI, new species

Depth $3\frac{1}{5}$ to $3\frac{1}{3}$; head $2\frac{1}{4}$ to $2\frac{2}{5}$; snout 3 to $3\frac{1}{8}$. Snout 3 in head from snout tip; eye $5\frac{1}{4}$ to $5\frac{1}{3}$, $1\frac{3}{4}$ to $1\frac{4}{5}$ in snout, subequal with interorbital; maxillary reaches $\frac{3}{5}$ to $\frac{2}{3}$ in eye, expansion $1\frac{1}{2}$ in eye, length 2 to $2\frac{1}{8}$ in head from snout tip; teeth villiform, in bands in jaws, on vomer and palatines; tongue slender, toothless; preopercle edge strongly denticulate, ridge entire, distinct; opercular spines 3, equidistant, median most posterior; interopercle and subopercle denticulate. Gill rakers 6+15, lanceolate, robust, greater than gill rakers or equal $1\frac{1}{2}$ in eye.

Scales 66 to 68 in lateral line to caudal base and 6 or 7 more on latter; 11 scales above lateral line, 34 below, 25 to 27 predorsal, 12 rows across cheek to preopercle ridge. Fins all scaleless, except cau-

Baldwin, C. C. and W. L. Smith. 1998. *Belonoperca pylei*, a new species of seabass (Teleostei: Serranidae: Epinephelinae: Diploprionini) from the Cook Islands with comments on relationships among diploprionins. Ichthyol. Res., 45 (4): 325–339.

Abstract *Belonoperca pylei* is described from five specimens collected at depths of 68–122 m from Rarotonga, Cook Islands. It differs from all other known diploprionin serranids in having IX, 10 dorsal-fin rays, III, 7 anal-fin rays, and a color pattern composed primarily of yellow and orange pigments. Cladistic analysis of epinepheline morphology supports monophyly of the diploprionin genera *Belonoperca* and *Diploprion* and suggests that *Belonoperca* is the sister group of *Diploprion* plus the monotypic *Aulacocephalus*.

Key words. — Serranidae; *Belonoperca*; Cook Islands; phylogeny; larval morphology.

Gasterosteus saltatrix Linnaeus, 1766

LSID urn:lsid:zoobank.org:act:FFF7160A-372D-40E9-9611-23AF5D9EAC4C

Rank: Species

Parent: [Gasterosteus Linnaeus, 1758](#)

Specific Name: saltatrix

Authorship: Linnaeus

Publication: [Linnaeus, Carolus. 1766 Systema naturae sive regna tria naturae, secundum classes, ordines, genera, species, cum characteribus, differentiis, synonymis, locis. Laurentii Salvii, Holmiae \[= Stockholm\]. Vol. **Tomus I**, No. 1, *Editio duodecima, reformata* Edition: 1-532.](#)

Page: 491

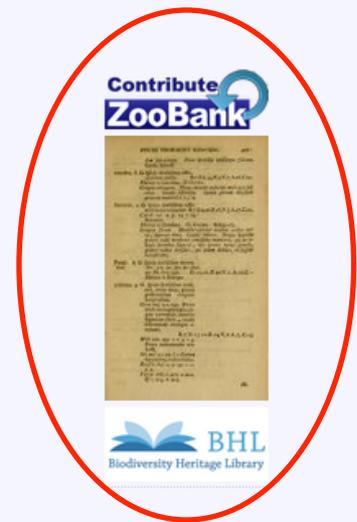

Figure(s):

Type Specimen(s): Syntypes: LS 116 (left head), 135 (left half-skin)

Type Locality: Carolina [South Carolina] and Virginia, U.S.A

Fossil: No

A Global Names Architecture

**Gee, Rich...that's
SUPER AWESOME!**

(But seriously... how is it *really* going to help me?)

Query-Time Taxonomic Translation

(The Power of Meta-Authorities)

Taxon Name Usage (e.g., of Page et al. 2013:143)

“I assert that the species epithet “*saltator*” of Linnaeus 1766, is spelled as such, and is valid at the rank of species within the genus “*Pomatomus*” of Lacépède 1802.”

Meta-Authority Treatment (e.g., Catalog of Life)

“With regard to the epithet “*saltator*” of Linnaeus 1766, we follow the treatment of Page et al. 2013:143”
