# Overview – Genomes, Environment and Digitization

---

- **We know genomes change over time and space...**
  - Temporal comparisons
  - Geographic comparisons
- **...but thus far we've focused on just one dimension of the genome – its sequence**
  - Genome expression and changing environments
  - Epigenetics and changing environments
- **How do we capture these data and what kinds of research will it enable?**
  - Need for renewed collection of diverse resources for genomics
  - Capturing these data and linking it to environmental change

## DUE DATES

Full Proposal Deadline Date: January 8, 2015

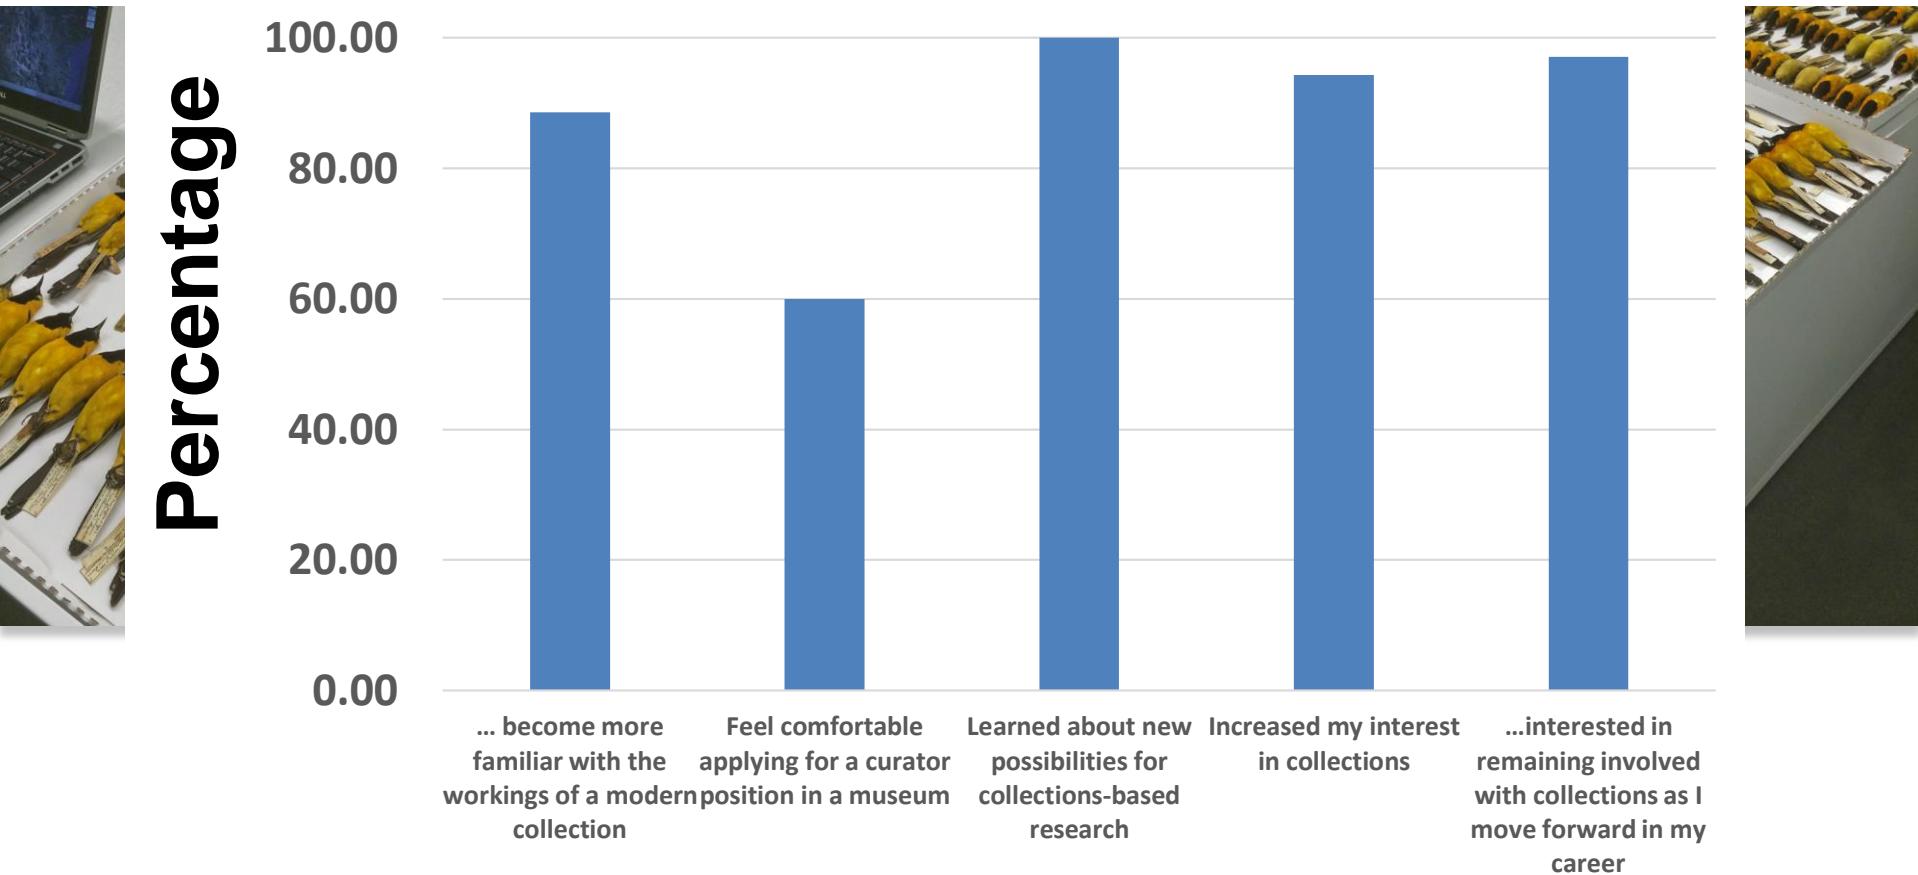

## SYNOPSIS

The Directorate for Biological Sciences (BIO) awards Postdoctoral Research Fellowships in Biology to recent recipients of the doctoral degree for research and training in selected areas supported by BIO and with special goals for human resource development in biology. The fellowships encourage independence at an early stage of the research career to permit Fellows to pursue their research and training goals in the most appropriate research locations regardless of the availability of funding for the Fellows at that site. For FY 2015 and beyond, these BIO programs are (1) *Broadening Participation of Groups Under-represented in Biology*, (2) *Research Using Biological Collections*, and (3) *National Plant Genome Initiative (NPGI) Postdoctoral Research Fellowships*. These areas change periodically as new scientific and infrastructure opportunities present themselves. For this reason, this solicitation will be changed as necessary to reflect the areas being funded.

The fellowships are also designed to provide active mentoring of the Fellows by the sponsoring scientists who will benefit from having these talented young scientists in their research groups. The research and training plan of each fellowship must address important scientific questions within the scope of the BIO Directorate and the specific guidelines in this fellowship program solicitation. Because the fellowships are offered to postdoctoral scientists only early in their careers, NSF encourages doctoral advisors to discuss the availability of these postdoctoral fellowships in biology with their graduate students early in their doctoral programs to ensure potential applicants may take advantage of this funding opportunity. Fellowships are awards to individuals, not institutions, and are administered by the Fellows.

# The NSF collections postdoctoral program broadens the collections community\*

*As a result of your postdoc, have you, do you or are you ....*

\*Based on a post-conference survey of 35 participants
